BAEP 557: Technology Commercialization, Spring 2023
*Team-Based Commercialization Project Proposals **(– ONE submission per team**)*

--Preliminary research (optional, for feedback – esp. #s 2, 3, 5): DUE noon, Tuesday of Wk 7 (2.21)
--Full final proposal, including completed *secondary* research:* DUE noon, Tuesday of Wk 8 (2.28)
--2.5 to 3 pgs (not including visuals, citations, appendixes), single-spaced, times new roman 12-point font
[*Make sure to *set up + start on* primary research / customer interviews *before* week 8)

Commercialization Proposal Overview

Like we discussed in class, your projects will be divided across several technology application focus areas. Your project proposal will outline your focus area, approach, and next steps. The five specifics are noted below, all building on concepts and frameworks we introduced in the first third of our course.

For each of sections #1 and #2 below, include at least *3* sources from *any* of the following: *academic* (ex.: IEEE, Academy of Management, HBR); *scientific* (ex.: Science, Nature); *newspaper* (ex.: WSJ, NYT). Please cite your research consistently using a bibliography in standard format (APA, Chicago, MLA). Blogs, Wikipedia, Reddit, etc. are useful for context but not formally a part of your submission.

1. Technology
Background research, using secondary sources to learn more about your team's application technology.

Your goal is to learn more about your specific technology and understand how it was developed, how it works, and how it has been applied. The outside project leads and experts will provide details soon.

2. Research on Application Option: Focus Area / Target Markets + Customers
Broad orientation to your team's commercial application area, industrial or commercial

Your goal for the *preliminary* phase is to confirm your application market and customer segment and make any adjustments you might need, with feedback from project leads, experts, and your professor.

For the full proposal, and as a foundation for discovery, you should establish a *broad* understanding of how your chosen organization / company and those who run it currently solve the problem your chosen technology addresses: How do they carry out their day-to-day tasks? What problems do they face, and how do they address them? What cost barriers do they face and what behavioral barriers do they exhibit?

3. Research Hypotheses
Based on # 2, what three or four questions related to your target market will you need to answer? These should be more than just exploratory (can our tech do X?) and precise, quantifiable and testable.

Your goal, at this stage, is simply to identify a baseline set of questions that will be modified, deepened and refined as you carry out your customer discovery and related research. You can continue to identify more specific hypotheses to generate findings about the market based on a more formal analysis using the CV Ingenuity case's 6 factors and other course frameworks. We will also be adding such details as operational considerations and financial calculations, so no need to include these yet.

4. Team Roles
Reach a consensus about who will play what role on your team: PM, research lead, etc.

5. Next Steps & Information Needs
What steps will you take in the next week or two? What information, if any, do you need from us?
